

ABSTRACT OF THE DISCLOSURE

Disclosed is a stirling cooler, in which a cylinder is
fixedly installed in a case, a flange is protruded
5 perpendicularly from an outer surface of the cylinder in a
radial direction of the cylinder, a stair on which the flange
is seated is installed in the case in an axial direction of
the cylinder, and a packing is interposed between the stair of
the case and the flange of the cylinder, thereby preventing
10 the packing from influencing an axis of the cylinder and thus
maintaining the sealed state between the case and the
cylinder.
